

Salesforce Assessment Case Study

Client: SecureLife Insurance

SecureLife Insurance manages policies and claims for customers across India.

Multiple teams work on the system, including sales, claims processing, management, and audit/compliance.

The leadership team has identified challenges in:

- Data visibility
- Access control
- Managing temporary and special permissions
- Scaling the system as teams grow

They want a **secure, flexible, and scalable access control system** designed in Salesforce.

Business Requirements

♦ Scenario A: Senior Claims Access

Certain members of the claims team need elevated capabilities:

- Ability to approve claims
- Ability to modify any claim in the system (not limited to their own records)

These users are part of the same team as other claims users.

♦ Scenario B: Temporary Cross-Team Support

At times, sales team members are assigned to support claims processing:

- They need limited access to claims (create and view)
 - This access is temporary (typically 2 weeks)
-

♦ Scenario C: Special Investigation Team (SIT)

A special team is formed to investigate suspicious claims:

- They require access to all claim records across regions
 - They should NOT have access to other business data
-

♦ Scenario D: Power Users

Some users across different teams require additional capabilities:

- Exporting reports
 - Performing bulk/mass updates
-

◆ **Scenario E: Project-Based Access**

A temporary cross-functional team is formed for a high-priority project:

- Members come from different departments
 - They need combined access to claims, reporting, and limited customer-related data
 - The access should be easy to assign and remove after the project ends
-

◆ **Scenario F: Audit & Compliance Requirements**

The audit team requires enhanced visibility:

- Read-only access to business data
- Ability to export reports
- Limited administrative visibility for audit purposes

The solution should avoid repeated manual changes whenever requirements evolve.

Your Task

Design a **complete Salesforce solution** that addresses the above requirements.

Your design should include (but not be limited to):

- Data structure
- Access control strategy
- User access management approach
- Handling of temporary and special access scenarios
- Scalability and maintainability considerations
